

Fungicide Efficacy for Control of Soybean Foliar Diseases

The North Central Regional Committee on Soybean Diseases (NCERA-137) has developed the following information on foliar fungicide efficacy for control of major foliar soybean diseases in the United States.

Efficacy ratings for each fungicide listed in the table were determined by field testing the materials over multiple years and locations by the members of the committee. Efficacy ratings are based upon level of disease control achieved by product, and are not necessarily reflective of yield responses obtained from product application.

Efficacy depends upon proper application timing, rate, and application method to achieve optimum effectiveness of the fungicide as determined by labeled instructions and overall level of disease in the field at the time of application. Differences in efficacy among fungicide products were determined by direct comparisons among products in field tests and are based on a single application of the labeled rate as listed in the table, unless otherwise noted.

For application timing and use considerations, contact your local cooperative extension service. The table includes systemic fungicides available that have been tested over multiple years and locations. It is not intended to be a list of all labeled products.

This information is provided only as a guide. It is the applicator's and user's legal responsibility to read and follow all current label directions. Reference in this publication to any specific commercial product, process, or service, or the use of any trade, firm, or corporation name is for general informational purposes only and does not constitute an endorsement, recommendation, or certification of any kind by members of the group. Individuals using such products assume responsibility for their use in accordance with current directions of the manufacturer. Efficacy categories: E=Excellent; VG=Very Good; G=Good; F=Fair; P=Poor; NR=Not Recommended; NL=Not Labeled for Use Against this Disease; U=Unknown efficacy or insufficient data to rank product.

Fungicide Efficacy for Control of Soybean Foliar Diseases¹

¹Multiple fungicides are labeled for soybean rust only, powdery mildew, and Alternaria leaf spot, including tebuconazole (multiple products) and myclobutanil (Laredo). Contact fungicides such as chlorothalonil may also be labeled for use.

²In areas where Qo1-fungicide resistant isolates of the brown spot pathogen are present, Qo1 fungicides may result in poor disease control.

³Cercospora leaf blight efficacy relies on accurate application timing, and standard R3 application timings may not provide adequate disease control. Fungicide efficacy may improve with earlier or later applications; however, efficacy has been inconsistent with some products. Fungicides with a solo or mixed Qo1 or MBC mode of action may not be effective in areas where Qo1 or MBC resistance has been detected in the fungal population that causes Cercospora leaf blight.

⁴In areas where Qo1-fungicide resistant isolates of the frogeye leaf spot pathogen are not present, Qo1 fungicides may be more effective than indicated in this table.

⁵White mold efficacy is based on R1-R2 application timing, and lower efficacy is obtained at R3 or later application timings, or if disease symptoms are already present at the time of application.

⁶Multiple generic products containing this mode of action may also be labeled in some states.

⁷Propulse is not labeled for use on soybean harvested for grain. Restrictions may vary for other types of soybean (edamame, etc.) and soybean for other uses such as forage or fodder.

⁸Stratego YLD has a supplemental label (2ee) for white mold on soybean only in IL, IN, IA, MI, MN, NE, ND, OH, SD, WI.

⁹Revytek is not labeled for use on soybean in all states as of January 2020.

¹⁰Stratego YLD is based on two applications of a 9 fl. oz./A rate of Aproach at R1 and R3.

¹¹Revytek is not labeled for use on soybean in all states as of January 2020.
